Mainframe applications get tuned by AQM

AQM Solutions Inc., a mainframe application performance company, has updated its TriTune software to improve monitoring of batch and SQL jobs.

This update affects two TriTune features: Application Performance Control (APC) and Dynamic SQL Performance Control (DSPC). APC tracks thousands of batch jobs running in z/OS DB2 environments and can now monitor information on CICS transactions. DSPC looks at SQL workloads in z/OS DB2 environments to help mainframe programmers tighten their queries to run more efficiently.

Osman Aykut, director of Boston-based AQM and chief technology officer of its parent company, German-based TRILOGexpert, said that TriTune can help mainframe shops identify programs that are taking up too much processing power and reduce that down to postpone upgrading the mainframe.
